                                                                                                                                                                                                                                                                The invention relates to a method for increasing isoflavonoid production in a plant, by transforming the plant with a recombinant DNA construct having a polynucleotide (PN) e.g., a PN encoding all or part of flavanone 3-hydroxylase, and second recombinant DNA construct having a PN encoding C1 myb and a R myc-type transcription factor, growing the transformed plant, and evaluating the quantity of isoflavonoid from the plant. The method of the invention is useful for increasing isoflavonoid production in an isoflavonoid-producing plant. The current sequence represents the seed-specific expression vector pKS151, into which a polynucleotide encoding a portion of soybean flavanone 3-hydroxylase was inserted in an example from the invention, for the transformation of Glycine max.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Increasing isoflavonoid production in an isoflavonoid-producing plant, comprises transforming a plant with recombinant DNA constructs, growing the transformed plant, and evaluating increased quantity of isoflavonoid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         13-JUN-2002;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               12-JUN-2003;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Isoflavonoid;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ્રફ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
                                isoflavones relative to the total isoflavones in an isoflavonoid-
isoflavones relative to the total isoflavones in an isoflavonoid-
isoflavones relative to the total isoflavones in an isoflavonoid-
isoflavones relative to the total isoflavones in an isoflavonoid-
isoflavonoid-
isoflavonoid-promoter operably linked to a nucleic acid
sequence of at least 200 nucleotides having at least 75% sequence
identity to ADQ07965 (a soybean chalcone reductase cDNA). Also included
are an isoflavonoid-producing plant made by the method above, seeds or
plant parts of the plant, an isoflavonoid-containing protein product
having a reduced ratio of liquiritigenin-derived isoflavones relative to
the total isoflavone levels obtained from the seeds or plant parts, a
food (or a nutritional supplement, a food bar, or a beverage) which has
incorporated the isoflavonoid-containing product, and a method of
producing an isoflavonoid-containing product, and a reduced ratio of
liquiritigenin-derived isoflavones relative to the total isoflavone
                                                                                                                                                                                                                                                                                                                                                                                            Decreasing ratio of liquiritigenin-derived isoflavones isoflavones in a plant comprises transforming plant ce acid sequence showing homology to sequence encoding characteristics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Seed
                                                                                                                                                                                                                                                                                                                                        Example 1;

The promoter is a seed-specific promoter. The method is useful for decreasing the ratio of liquiritigenin derived isoflavones relative to the total isoflavones in an isoflavone-producing plant. The methods and recombinant construct are useful in producing an isoflavonoid-containing product which is incorporated in cereal food product, snack food product, baked good product, fried food product, health food product, infant formula, beverage, nutritional supplement, dairy product, pet food product, or animal feed. The present sequence is the Seed specific gene silencing vector pKS151, into which the soybean cDNA is cloned (into the NotI site flanked by the stem regions of ADQ07968.

Example 1; SEQ ID NO 1; 25pp; English

cc producing plant comprising transforming a plant cell with a recombinant construct comprising a promoter operably linked to a nucleic acid construct comprising a promoter operably linked to a nucleic acid construct comprising a promoter operably linked to a nucleic acid construct of at least 200 nucleotides having at least 75% sequence care an isoflavonoid-producing plant made by the method above, seeds or compared the plant, an isoflavonoid-containing protein product the total isoflavone levels obtained from the seeds or plant parts, a conditional supplement, a food bar, or a beverage) which has concurred incorporated the isoflavonoid-containing product, and a method of producing an isoflavonoid-containing product, and a method of liquiritigenin-derived isoflavones relative to the total isoflavone containing product, and a method of producing an isoflavonoid-containing product, and a method of liquiritigenin-derived isoflavones relative to the total isoflavone containing product having a reduced ratio of liquiritigenin-derived isoflavones relative to the total isoflavone containing product having a reduced ratio of liquiritigenin comprises a stem-loop structure. The mucleic acid sequence of ADQ07968). The promoter is a seed-specific product, plant. The methods and recombinant construct are useful in product, pack food product, which is incorporated in corporated food product, peatone, infant formula, beverage, nutritional supplement, dairy product, pet food product, or animal feed. The present construe is the Seed specific gene silencing vector pKS151, into which construe to the NotI site flanked by the stem The isoflavones relative to the regions of ADQ07968. relates 6 decreasing the ratio of liquirit the total isoflavones in an isofl igenin-derived avonoid-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to plastidic phosphoglucomutase polypeptides and contrarsgenic plant, by transforming a plant cell with a polynucleotide of the invention and regenerating a plant from the transformed plant cell. Contrarsgenic plant from the transformed plant cell. Contrarsgenic plant are useful for suppressing the level of expression of a gene encoding a polypeptide having plastidic phosphoglucomutase activity. An isolated polynucleotide that affects the contrar cell can be identified by introducing a DNA fragment comprising at least 541 nucleotides, measuring the level of the polypeptide in the polynucleotide, and comparing the level of the polypeptide in the polypeptide in the polypeptide in the polypeptide in the level of the polypeptide in a plant cell containing the isolated polynucleotide with the contaited polynucleotide. A method for altering the level of expression of a plastidic phosphoglucomutase protein in a host cell comprises transforming a host cell with a chimeric gene and growing the transformed containing the level of the polypeptide in a plant cell that does not contain the containing the level of expression of the polynucleotide. A method for altering the level of expression of the polynucleotide in a plant cell that does not contain the containing the level of expression of the polynucleotide in the polynucleotide in a host cell comprises transformed contacted polynucleotide in the gene results in production of the chimeric gene, where the expression of the gene results in production of altered contain the methods of the invention. Note: This sequence is not confident in the printed specification but is based on sequence in a formation supplied by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

transgenic plant, by transforming a plant cell with a polynucleotide of the invention and regenerating a plant from the transformed plant cell. CC Polynucleotide fragments are useful for suppression the level of ce prosphoglucomutase activity. An isolated polynucleotide in a cc level of expression of a plastidic phosphoglucomutase polypeptide in a cc plant cell can be identified by introducing a DNA fragment comprising at cell containing the polynucleotide the level of the polypeptide in a plant cell containing the level of the polypeptide with cc the level of the polypeptide. A method for altering the level of expression of cell under conditions that are suitable for expression of the chimeric gene, where the expression of the gene results in production of altered contains of plastidic phosphoglucomutase. This sequence represents plasmid conformation supplied by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel isolated polypeptides having phosphoglucomutase ac polynucleotides encoding the polypeptides, useful for protransgenic plants with altered plastidic phosphoglucomutations.

                                                                                                                                                             밁
                                                                                                                                                                                    Ś
                                                                                                                                                                                                                                             S
                                                                                                                                                                                                                                                                                                                                  The present invention relates to diverged delta-9 fatty acid desaturase proteins and polynucleotides encoding such proteins. The nucleic acid sequences may be used to increase the level of unsaturation in cellular lipids, including oil, in tissues when the enzyme is absent or rate-climiting, to isolate cDNAs and genes encoding homologous proteins from the same or other plant species and to create transgenic plants in which the polypeptides are present at higher or lower levels than normal or in cell types or developmental stages in which they are not normally found, thus altering the level of mono-, poly- and unsaturated fatty acids in those cells. They are useful as probes for genetic and physical gene mapping and as markers, e.g. restriction fragment length polymorphism (RFLP) markers. The peptides can be used to immunise animals to produce antibodies specific for the peptides and proteins. The present sequence is plasmid pBS68 which is used for the suppression of diverged delta-9 desaturase in high stearate phenotypes. This sequence is used in the expuence (AAD32909) corresponding to position 1501 to 6611 is not represented in the printed specification but is based on the sequence information supplied by the European patent office

                                                    S
                                                                                                                                The present invention relates to diverged delta-9 fatty acid desaturase CC proteins and polynucleotides encoding such proteins. The nucleic acid CC sequences may be used to increase the level of unsaturation in cellular CC limiting, to isolate cDNAs and genes encoding homologous proteins from CC the same or other plant species and to create transgenic plants in which the polypeptides are present at higher or lower levels than normal or in CC cell types or developmental stages in which they are not normally found, those cells. They are useful as probes for genetic and physical gene CC (RFLP) markers, e.g. restriction fragment length polymorphism CC antibodies specific for the peptides and proteins. The present sequence is plasmid pBS68 which is used for the suppression of diverged delta-9 desaturase in high stearate phenotypes. This sequence is used in the CC sequence (AAD32909) corresponding to position 1501 to 6611 is not crepresented in the printed specification but is based on the sequence CC information supplied by the European patent office

                                                                    The invention relates to plastidic phosphoglucomutase polypeptides and their related nucleic acids. The sequences are useful for producing a transgenic plant, by transforming a plant cell with a polynucleotide of the invention and regenerating a plant from the transformed plant cell. Polynucleotide fragments are useful for suppressing the level of compression of a gene encoding a plant from the transformed plant cell. Polynucleotide fragments are useful for suppressing the level of expression of a plastidic phosphoglucomutase polypeptide in a plant cell can be identified by introducing a DNA fragment comprising at cell can be identified by introducing a DNA fragment comprising at plant cell containing the level of the polypeptide in the isolated polynucleotide with the level of the polypeptide in a plant cell that does not contain the cisolated polynucleotide. A method for altering the level of expression of the plastidic phosphoglucomutase protein in a host cell comprises call under conditions that are suitable for expression of the chimeric gene, where the expression of the gene results in production of altered contifical DNA used for plasmid construction, in the methods of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            17-JUL-2001; 2001EP-00306143

The invention relates to plastidic phosphoglucomutase polypeptides and their related nucleic acids. The sequences are useful for producing a transgenic plant, by transforming a plant cell with a polynucleotide of the invention and regenerating a plant from the transformed plant cell. Polynucleotide fragments are useful for suppressing the level of expression of a gene encoding a polypeptide having plastidic phosphoglucomutase activity. An isolated polynucleotide that affects the level of expression of a plastidic phosphoglucomutase polypeptide in a plant cell can be identified by introducing a DNA fragment comprising at least 541 nucleotides, measuring the level of the polypeptide in the plant cell containing the polynucleotide, and comparing the level of the polypeptide in the pol
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0711/C

The present invention relates to a new recombinant construct. The construct comprises a promoter operably linked to a DNA sequence which when expressed by a host produces an RNA having homology to at least one target mRNA expressed by the host and complementary RNA regions. The recombinant construct is useful for reducing the expression of a target mRNA or any similar endogenous mRNA. The RNAs expression of a target recombinant constructs are also used in reducing expression of a target mRNA or any similar endogenous mRNA. The sequences and their reverse complements can be used to reduce the expression of any endogenous genomic sequence that shares substantial similarity to nucleic acid fragment which is in proximity to the DNA or RNA sequence derived from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Glassman

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               isolated polynucleotide. A method for altering the level of expression of a plastidic phosphoglucomutase protein in a host cell comprises transforming a host cell with a chimeric gene and growing the transformed cell under conditions that are suitable for expression of the chimeric gene, where the expression of the gene results in production of altered levels of plastidic phosphoglucomutase. This sequence represents an altericial DNA used for plasmid construction, in the methods of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (PUON-)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
The present invention relates to a new recombinant construct. The construct comprises a promoter operably linked to a DNA sequence when expressed by a host produces an RNA having homology to at leat target mRNA expressed by the host and complementary RNA regions. Trecombinant construct is useful for reducing the expression of a tmRNA or any similar endogenous mRNA. The RNAs expression of a tmRNA or any similar endogenous mRNA. The sequences and their rever complements can be used to reduce the expression of any endogenous genomic sequence that shares substantial similarity to nucleic aci fragment which is in proximity to the DNA or RNA sequence derived it. The present sequence is 2X ELVISLIVES complementary region from
                                                                                                                                                                                                                                                                                                                                                                                      mRNA and its reverse
                                                                                                                                                                                                                                                                                                                                                                                                                                      New recombinant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Recombinant construct; gene expression; late-soybean-emb LEA; galactinol synthase; GAS1; GAS2; plasmid pBS149; ds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         it. The present sequence is 2X ELVISLIVES complementary region from pBS149 that contains fragments from two soybean galactinol synthase genes GAS1 and GAS2. The region is functionally attached to a late-soybean-embryo promoter (LEA) and a phaseolin 3' terminator region. This entire region is then cloned into BamHI site of pKS136, which contains a 2X ELVISLIVES complementary region controlled by a soybean Kti promoter and terminator region used in the exemplification of the invention

The region is functionally attached to a late-soybembryo promoter (LEA) and a phaseolin 3' terminator region. This region is then cloned into BamHI site of pKS136, which contains a ELVISLIVES complementary region controlled by a soybean Kti promoterminator region used in the exemplification of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           mRNA or any similar endogenous mRNA. The RNAs expressed from the recombinant constructs are also used in reducing expression of a target mRNA or any similar endogenous mRNA. The sequences and their reverse complements can be used to reduce the expression of any endogenous genomic sequence that shares substantial similarity to nucleic acid fragment which is in proximity to the DNA or RNA sequence derived from it. The present sequence is 1X ELVISLIVES complementary repeat region DNA found in plasmids pKS106 and pKS124 used in the exemplification of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a new recombinant construct. The construct comprises a promoter operably linked to a DNA sequence which when expressed by a host produces an RNA having homology to at least one target mRNA expressed by the host and complementary RNA regions. The recombinant construct is useful for reducing the expression of a target mRNA or any similar endogenous mRNA. The RNAs expression of a target mRNA or any similar endogenous mRNA. The sequences and their reverse complements can be used to reduce the expression of any endogenous genomic sequence that shares substantial similarity to nucleic acid fragment which is in proximity to the DNA or RNA sequence derived from it. The present sequence is 1X ELVISLIVES complementary repeat region DNA found in plasmids pKS106 and pKS124 used in the exemplification of the
                  New delta-9 fatty acid desaturase polypeptides and polynucleotides, useful in creating transgenic plants having altered levels of mono-, and unsaturated fatty acids and in increasing the unsaturation levels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Diverged delta-9 fatty acid desaturase; enzyme; transgenic plant; gene mapping; immunisation; plasmid pKS106; gene; ds.

proteins and polynucleotides encoding such proteins. The nucleic acid sequences may be used to increase the level of unsaturation in cellular CC lipids, including oil, in tissues when the enzyme is absent or rate-CC limiting, to isolate cDNAs and genes encoding homologous proteins from the same or other plant species and to create transgenic plants in which the polypeptides are present at higher or lower levels than normal or in cell types or developmental stages in which they are not normally found, those cells. They are useful as probes for genetic and physical gene CC mapping and as markers, e.g. restriction fragment length polymorphism CC (RFLP) markers. The peptides can be used to immunise animals to produce is IX ELVISLIVES complementary repeat region DNA found in plasmids pKS106 and pKS124. This sequence is used in the exemplification of the invention for the suppression of Fad2 in soybean

cc proteins and polynucleotides encoding such proteins. The nucleic acid desaturase groteins and polynucleotides encoding such proteins. The nucleic acid control of the same or character of the same or other plant species and genes encoding homologous proteins from the polypeptides are present at higher or lower levels than normal or in those cell types or developmental stages in which they are not normally found, thus altering the level of mono-, poly- and unsaturated fatty acids in those cells. They are useful as probes for genetic and physical gene mapping and as markers, e.g. restriction fragment length polymorphism (RFLP) markers. The peptides can be used to immunise animals to produce is 1X ELVISLIVES complementary repeat region DNA found in plasmids pKS106 cor the suppression of Fad2 in soybean

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          their related nucleic acids. The sequences are useful for producing a transgenic plant, by transforming a plant cell with a polynucleotide of the invention and regenerating a plant from the transformed plant cell. Polynucleotide fragments are useful for suppressing the level of expression of a gene encoding a polypeptide having plastidic phosphoglucomutase activity. An isolated polynucleotide that affects the level of expression of a plastidic phosphoglucomutase polypeptide in a plant cell can be identified by introducing a DNA fragment comprising at plant cell containing the level of the polypeptide in the polynucleotide, and comparing the level of the level of the plant cell containing the level of the polypeptide in the plant cell containing the isolated polynucleotide with the level of the polypeptide in a plant cell that does not contain the collated polynucleotide. A method for altering the level of expression of the plastidic phosphoglucomutase protein in a host cell comprises cell under conditions that are suitable for expression of the chimeric gene, where the expression of the gene results in production of altered convention. DNA used for plasmid construction, in the methods of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁

The sequences are useful for producing a contransperic plant, by transforming a plant cell with a polynucleotide of the invention and regenerating a plant from the transformed plant cell. Polynucleotide fragments are useful for suppressing the level of colynucleotide fragments are useful for suppressing the level of expression of a gene encoding a polypeptide having plastidic phosphoglucomutase activity. An isolated polynucleotide that affects the level of expression of a plastidic phosphoglucomutase polypeptide in a collective plant cell can be identified by introducing a DNA fragment comprising at plant cell containing the level of the polypeptide in a plant cell that does not contain the compression of the level of the polypeptide in a plant cell that does not contain the collated polynucleotide. A method for altering the level of expression of a plastidic phosphoglucomutase protein in a host cell comprises call under conditions that are suitable for expression of the chimeric gene, where the expression of the gene results in production of altered convention.

New recombinant construct having a promoter operably linked to sequence which when expressed produces an RNA having homology tmRNA and its reverse complement unrelated to endogenous DNA, for gene expression.

for 0 J

DNA
a target
reducing

The present invention relates to a new recombinant construct comprises a promoter operably linked to a DNA when expressed by a host produces an RNA having homology target mRNA expressed by the host and complementary RNA recombinant construct is useful for reducing the express

truct. The sequence which y to at least one regions. The sion of a target

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a new recombinant construct. The construct comprises a promoter operably linked to a DNA sequence which when expressed by a host produces an RNA having homology to at least one target mRNA expressed by the host and complementary RNA regions. The recombinant construct is useful for reducing the expression of a target mRNA or any similar endogenous mRNA. The RNAs expressed from the recombinant constructs are also used in reducing expression of a target mRNA or any similar endogenous mRNA. The sequences and their reverse complements can be used to reduce the expression of any endogenous genomic sequence that shares substantial similarity to nucleic acid fragment which is in proximity to the DNA or RNA sequence derived from it. The present sequence is a PCR primer used for amplifying ELVISLIVES complementary region DNA used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 07-MAY-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        03-JAN-2002.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ELVISLIVES

The present invention relates to a new recombinant construct. The construct comprises a promoter operably linked to a DNA sequence which when expressed by a host produces an RNA having homology to at least one target mRNA expressed by the host and complementary RNA regions. The recombinant construct is useful for reducing the expression of a target mRNA or any similar endogenous mRNA. The RNAs expression of a target mRNA or any similar endogenous mRNA. The sequences and their reverse complements can be used to reduce the expression of any endogenous genomic sequence that shares substantial similarity to nucleic acid fragment which is in proximity to the DNA or RNA sequence derived from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           mRNA or any similar endogenous mRNA. The RNAs expressed from the recombinant constructs are also used in reducing expression of a target mRNA or any similar endogenous mRNA. The sequences and their reverse complements can be used to reduce the expression of any endogenous genomic sequence that shares substantial similarity to nucleic acid fragment which is in proximity to the DNA or RNA sequence derived from it. The present sequence is a PCR primer used for amplifying ELVISLIVES complementary region DNA used in the exemplification of the invention
                                                                                                                                                                                          New recombinant construct having a promoter operably linked to a sequence which when expressed produces an RNA having homology to mRNA and its reverse complement unrelated to endogenous DNA, for

                                     The present invention relates to a new recombinant construct. The CC construct comprises a promoter operably linked to a DNA sequence which construct tomprises a promoter operably linked to a DNA sequence which combined the expressed by a host produces an RNA having homology to at least one target mRNA expressed by the host and complementary RNA regions. The recombinant construct is useful for reducing the expression of a target recombinant constructs are also used in reducing expression of a target complements can be used to reduce the sequences and their reverse complements can be used to reduce the expression of any endogenous complement which is in proximity to the DNA or RNA sequence derived from the present sequence is 2x ELVISLIVES complementary regions surrounding the the contains 2x ELVISLIVES complementary regions surrounding the the invention a soybean delta-9 desaturase gene used in the exemplification of the

transgenic plant, by transforming a plant cell with a polymucleotide of the invention and regenerating a plant from the transformed plant cell. CC Polymucleotide fragments are useful for suppressing the level of expression of a gene encoding a polymetide having plastidic plant cell. CC phosphoglucomutase activity. An isolated polymucleotide in a CC plant cell can be identified by introducing a DNA fragment comprising at least 541 nucleotides, measuring the level of the polymeptide in a plant cell containing the polymucleotide, and comparing the level of the level of the polymeptide in a plant cell that does not contain the CC isolated polymucleotide. A method for altering the level of expression of a plastidic phosphoglucomutase protein in a host cell comprises transforming a host cell with a chimeric gene and growing the transformed CC gene, where the expression of the gene results in production of altered clevels of plastidic phosphoglucomutase. This sequence represents an artificial DNA used for plasmid construction. in the cartificial DNA used for plasmid construction.

transgenic plant, by transforming a plant cell with a polypeptides and transgenic plant, by transforming a plant cell with a polynucleotide of the invention and regenerating a plant from the transformed plant cell. Polynucleotide fragments are useful for suppressing the level of expression of a gene encoding a polypeptide having plastidic phosphoglucomutase activity. An isolated polynucleotide that affects the level of expression of a plastidic phosphoglucomutase polypeptide in a plant cell can be identified by introducing a DNA fragment comprising at least 541 nucleotides, measuring the level of the polypeptide in the level of the polypeptide. A method for altering the level of expression of a plastidic phosphoglucomutase protein in a host cell comprises transforming a host cell with a chimeric gene and growing the transforming that are suitable.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                     quorum sensing signalling in bacteria. The method comprises: providing a cell that comprises a quorum sensing controlled gene (ADS14446-ADS14798), where the cell is responsive to a quorum sensing signal molecule such that a detectable signal is generated; contacting the cell with a quorum sensing signal molecule in the presence and absence of a test compound; and detecting a change in the detectable signal. The method and modulator identified by the method are useful for treating a biofilm-associated disease or disorder, e.g. cystic fibrosis, AIDS, middle ear infections, acne, periodontal disease, catheter-associated infections, and medical device-associated infections. Note: The sequence data for this patent was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                 cell that comprises a quorum sensing controlled gene (ADS14446-ADS14798), where the cell is responsive to a quorum sensing signal molecule such that a detectable signal is generated; contacting the cell with a quorum sensing signal molecule in the presence and absence of a test compound; and detecting a change in the detectable signal. The method and modulator identified by the method are useful for treating a biofilm-associated disease or disorder, e.g. cystic fibrosis, AIDS, middle ear infections, acne, periodontal disease, catheter-associated infections, and medical device-associated infections. Note: The sequence data for this patent was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cytostatic; Anti-HIV; Antimicrobial; Immunosuppressive; quorum sensing signalling; bacterium; quorum sensing combiofilm-associated disease; cystic fibrosis; AIDS; middacne; periodontal disease; gene; ds; PA4304.
                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a method for identifying a modulator of quorum sensing signalling in bacteria. The method comprises: providing a

The invention relates to plant nucleotide sequences that direct seed-
cc leaf- and/or stem-, panicle-, root- or pollen-specific or -preferential
cc or constitutive transcription of an operatively linked nucleic acid
segment. The invention also relates to a method for augmenting a plant
cc genome and a method of identifying a gene, where its expression is
altered in the seed, leaf, stem, panicle, pollen, root or is constitutive
in a plant cell. The plant is a cereal, e.g. soybean, alfalfa, sunflower,
cc canola, cotton, peanut, tobacco or sugar beet, preferably maize, barley,
sorghum, rice or wheat. The polynucleotides and the polypeptides they
cencode are useful for manipulating crop plants to alter or improve
phenotypic characteristics, to produce large quantities of oil or
proteins, to incur resistance to insecticides, viruses or fungi, and to
incur stress tolerance (e.g. salt, cold or drought) to ensure the plants
chave a high nutritional value with reduced apical dominance or dwarfism,
carly flowering or altered metabolic pathways. This sequence represents a
complete the invention. Note: The sequence data for this

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                or constitutive transcription of an operatively linked nucleic acid segment. The invention also relates to a method for augmenting a plant genome and a method of identifying a gene, where its expression is caltered in the seed, leaf, stem, panicle, pollen, root or is constitutive in a plant cell. The plant is a cereal, e.g. soybean, alfalfa, sunflower, consola, cotton, peanut, tobacco or sugar beet, preferably maize, barley, sorghum, rice or wheat. The polynucleotides and the polypetides they cencode are useful for manipulating crop plants to alter or improve phenotypic characteristics, to produce large quantities of oil or proteins, to incur resistance to insecticides, viruses or fungi, and to incur stress tolerance (e.g. salt, cold or drought) to ensure the plants carry flowering or altered metabolic pathways. This sequence represents a plant nucleic acid of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO at sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       101
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   84
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0
```

The invention relates to a nucleic acid probe for measuring human expression, comprising any of the 27,400 fully defined nucleotide sequences in the specification, or their complements or fragments,

g human gene leotide

and

밁 S 망 S

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cc encoding at least 8 amino acids of any of the 6888 amino acid sequences cfully defined in the specification. The probe is a single exon probe that chybridises under high stringency conditions to a nucleic acid molecule capressed in human cells or tissues. Also included are a spatially-capture seed in human cells or tissues. Also included are a spatially-capture seed in human cells or tissues. Also included are a spatially-capture seed in the plurality of single exon nucleic acid probes for measuring human comparising a plurality of grobes is separately captured expression, a vector comprising the single exon nucleic acid captured expression, a method of measuring human gene expression, a vector comprising the single exon contiguous amino acids of any of the above-mentioned amino acid sequences (optionally with conservative amino acid substitutions), an contiguous amino acids of any of the above-mentioned amino acid constitutions of selling and/or licensing single exon probes or microarrays to consider data that should be specifically to a peptide cited above, comethods of selling and/or licensing single exon probes or microarrays to consider the prosection and a computer-readable captured expression and a computer-readable captured expression and a plurality of records (each record including data on the expression, a method of providing captured exoression analysis. The probes may be used as tools for surveying captured exon, or in constructing genome-derived single exon microarrays. Comparession analysis. The probes may be used as tools for surveying captured exon, or in constructing genome-derived single exon microarrays. Comparession analysis, in priming the synthesis of nucleic acids, or in expressing the open acid of expressing and characterising gross single exon probe of the invention. Note: The sequence is a human captured to did not form part of the printed specification, but was obtained captured in electronic format directly from USPTO at the printed specification, but was obtained captured to the

                                                                                                                                                                                                                                                                                        맑
                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a nucleic acid probe for measuring human gene compression, comprising any of the 27,400 fully defined nucleotide sequences in the specification, or their complements or fragments, and conding at least 8 amino acids of any of the 6888 amino acid sequences (fully defined in the specification. The probe is a single exon probe that the probability of the 6888 amino acid sequences (comprising at least 8 amino acid soft on the following the compression of the specification of the plurality of a nucleic acid molecule conditions to the acid probes of separately and addressably isolatable or amplifiable from the plurality, a single exon microarray for measuring human gene expression, a method of measuring human gene expression, a method of providing the single exon microarray to contiguous amino acids of any of the above—mentioned amino acid sequences (optionally with conservative amino acid substitutions), and computer-readable or methods of selling and/or licensing single exon probes or microarrays to constitute the probes of any subscription, and a computer-readable of the storage medium which contains a database having a plurality of records cited above. The probes may be used as tools for surveying to each record including data on the expression of a single exon probe cited above. The probes may be used as tools for surveying their specific exon, or in constructing genome—derived single exon microarrays. Comparison the probes are used in identifying and characterising gross alternative splicing events in detecting and characterising gross alternative form probe of the invention. Note: The sequence is a human condition
                                                                                                                                                                                                                                                                                                                        S

                                                                                                                                                                                           The present invention relates to recombinant DNA vectors (cosmids) tencode for the narbonolide polyketide synthase (PKS) enzyme and vari narbomycin modification enzymes from Streptomyces narbonensis. The recombinant DNA vectors can be used to produce recombinant ketide synthases and a variety of different polyketides (e.g. erythromycin, rapamycin, tylosin, narbomycin, picromycin, methylmycin and neomethymycin) for use in agriculture, medicine and health. The recombinant vectors may be used to produce polyketides in relatively yields. AAS18432-AAS18443 represent contig DNA sequences that encode S. narbonensis PKS enzymes
                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                   Claim 1;

                                                                     ADL91894
                                                ADL91894;
                                                                                                                                                                                                                                                                                      rapamycin, tylosin, narbomycin, picromycin, methylmycin neomethymycin) for use in agriculture, medicine and heal recombinant vectors may be used to produce polyketides i yields. AAS18432-AAS18443 represent contig DNA sequences
                                                                                                                                                                                                                                                                                                                                  The present invention relates to recombinant DNA vectors (cosmids) encode for the narbonolide polyketide synthase (PKS) enzyme and va narbomycin modification enzymes from Streptomyces narbonensis. The recombinant DNA vectors can be used to produce recombinant ketide synthases and a variety of different polyketides (e.g. erythromycinants).
                                                                                                                                                                                                                                                                                                                                                                                 The
                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acids encoding narbonolide polyketide synthases from Streptomyces narbonensis, useful for the recombinant production of polyketides, e.g.

The DNA sequence of the invention are useful for providing polyhydroxyalkanoate monomer for medical and industrial applications. The present DNA sequence represents a Streptomyces narbonensis narbonolide polyketide synthase coding sequence of the invention.
